

Friends, Romans, ZSA members lend me your eyes and reading ability,

Today we vibed and learned about the Sea Devil (think the fish that tries to eat Dory and Marlin in Finding Nemo but smaller). The Sea Devil females can grow to the size of a baseball and live in the deep depths of the ocean. The males are the size of a parasite and can only survive by latching on to a female. The Sea Devil has well developed olfactory organs to help them live in almost complete darkness.

We rate the Sea Devil a 1/10 on land as we would be able to play baseball with the female and we don't even need to worry about the male. In the water we give it 10/10 as the water alone would crush us but we also can't sniff the way they can in total darkness so we would be goners.

A new semester means dues! If you didn't pay for the year, dues this semester are 20\$ and you can venmo @MSUZSA. This will give you active member status for the year.

This is a great time to join AZA and get a full year of zoo updates and job postings. If you are a zoo and aquarium concentration this is a great resume builder!

Annika's Joke corner:

as always, stay safe and join us next week for a fun filled meeting (same time (7pm) and place(the internet))

Love,

ZSA E-Board
